

TenderSense — Project BRD

Purpose: Explain your idea clearly enough that a registered team, who did not submit it but can read it, understand it, and decide to build it.

Recommended length: 2–4 pages. Short, clear bullet points beat long paragraphs to write for a team meeting this idea for the first time.

1. Project Name

TenderSense

2. Project Owner

Aisha Tanjina · Employee PIN: 2348

3. Problem Statement

BracIT bids for government and development-sector contracts in Bangladesh and internationally — but regularly finds out about tenders too late, or misses them entirely.

- **USD 24 billion** flows through e-GP Bangladesh annually, generating **20,000+ new tenders per month** (*BPPA / TBS News, 2025*)
- **89% of e-GP tenders receive only one bid** (*Transparency International Bangladesh, 2023*). Not because there are no qualified firms — but because most, including BracIT, don't know about the tender in time to respond.
- **No AI tool covers e-GP Bangladesh today.** Existing tools (Jorpex, BDTender) either don't cover Bangladesh or offer basic keyword alerts with no intelligence behind them.
- **Seeing more tenders isn't the answer — seeing the right ones is.** BracIT's advantage is showing up for tenders it's actually qualified to win, before the deadline, before competitors notice.

4. Proposed Solution

TenderSense watches procurement portals, finds tenders that match BracIT's services and experience, filters out ones BracIT can't bid on, and sends a ranked shortlist to the BD team every morning.

How it works:

1. **Collect** — pulls new tenders from e-GP Bangladesh and World Bank STEP automatically each day
2. **Match** — AI compares each tender against BracIT's profile (past projects, services, certifications) by meaning, not just keywords
3. **Filter** — automatically flags tenders BracIT can't bid on (wrong turnover, missing certification, geography) with a clear reason
4. **Deliver** — a ranked daily shortlist: match grade (S/A/B/C) · why it matched · what's needed to bid · days until deadline

What gets built in 7 days:

- **Portals:** e-GP Bangladesh + World Bank STEP
- **Test dataset:** 40 labeled tenders provided on Day 1 — no scraping needed to start
- **Demo:** one live tender pulled and scored on stage, pre-recorded backup ready if needed
- **Future:** UNGM / ADB / NGO feeds · Bangla-language support · automated bid/no-go logging

Demo scenarios (3 live cases):

Tender	Match Tier	Eligibility	Action
World Bank — IT consulting, South Asia	S	Eligible	Bid
ADB — digital transformation advisory	A	Eligible	Bid
e-GP — MIS development, BRAC programme	S	Check: turnover threshold	Verify

5. Target Users

- **BracIT BD team** (*primary*): gets a ready-to-act shortlist each morning — no manual portal checking needed
- **BD unit lead:** keeps BracIT's profile up to date (services, certifications, past work) and makes final bid decisions based on the shortlist

6. Key Features

- Automatically monitors e-GP Bangladesh and World Bank STEP for new tenders daily
- Matches by meaning — finds "ICT systems implementation" when a tender says "digital governance capacity building"
- Hard eligibility check (rules-based, not AI) — flags tenders BracIT can't bid on with a clear reason
- Plain-language explanation of why each tender matched and what BracIT still needs to bid
- Match grades S / A / B / C — easy to act on, no confusing percentages
- Urgency flags for tenders with tight deadlines
- Clear bid / hold / skip recommendation per tender

7. AI Component

Component	Type	What it does
Matching model	AI	Reads tender descriptions and BracIT's profile, understands the meaning of both, and scores how well they fit — even when the exact words don't match
Summary writer	AI (text generation)	Writes the "why this matched" and "what's missing" explanation for each tender. Used only for readable summaries — not for any pass/fail decision
Eligibility checker	Fixed rules (not AI)	Checks hard requirements: minimum turnover, required certifications, allowed geographies. Either BracIT qualifies or it doesn't — no guesswork
BracIT profile	Structured data	BracIT's services, past contracts, and certifications — what every tender gets compared against

Why rules for eligibility, not AI? Eligibility is a yes/no compliance question. Using AI for a pass/fail decision introduces unnecessary risk. Fixed rules are transparent, consistent, and always correct.

Why AI for matching, not keyword search? Keyword search would miss a tender for "capacity building in digital governance" even though BracIT's profile says "ICT systems implementation." The AI understands they mean the same thing.

8. Expected Outcome / Impact

- The BD team starts every day with a ready-to-act shortlist — no more manually checking portals
- No relevant tender is missed because it was found too late
- The team bids on fewer, better-fit tenders — less wasted effort, higher chance of winning
- Surfaces international tenders (World Bank, STEP) that BracIT is already qualified for but not actively watching
- Runs on top of the existing BD team with no new headcount

9. Data / Resources Required

Resource	Where it comes from	Notes
e-GP Bangladesh tenders	Public portal — scraped by the team	Publicly available, no access restrictions
World Bank STEP tenders	World Bank public portal — scraped by the team	Publicly available, no access restrictions
BracIT capability profile	Provided by the project owner on Day 1	BracIT's services, 10+ past projects, certifications, and annual turnover
40 labeled test tenders	Provided by the project owner on Day 1	Pre-labeled relevant / not relevant — ready to use immediately, no manual labeling needed
AI matching model	OpenAI or open-source (sentence-transformers)	Free open-source option available as fallback
Text generation model	GPT-4o-mini or Claude Haiku	Used only to write match summaries — low cost

10. Success Criteria

What we're checking	Target	How
Matching accuracy	TenderSense puts more relevant tenders in the top results than a simple keyword search	Run both systems against 12 test tenders the build team hasn't seen. Count how many of each system's top 5 picks are actually relevant.
Speed	Under 60 seconds to process one tender, vs. ~2 hours done manually	Timed live on the test dataset during demo
Live tender pull	One real tender fetched from a live portal and scored during the demo	Pre-recorded backup ready if network fails — will be disclosed on stage
Demo clarity	All 3 example tenders are easy to understand: a strong match, a borderline case, and a clear rejection — each with a reason	Rehearsed on the test dataset before demo day

Why Should You Build This?

This tool is useful the day after the hackathon ends. The BD team is already checking these portals by hand every day — TenderSense replaces that with a ranked shortlist delivered automatically every morning. The data needed to make it work (BracIT's past contracts, services, and certifications) already exists internally. No existing tool combines e-GP Bangladesh with World Bank procurement and AI-based matching tailored to a specific firm. BDTender covers Bangladesh but has no AI. Jorpex covers development sector work but not firm-specific matching. TenderSense fills both gaps — for the one firm best placed to use it from day one: BracIT itself.

Submitting: Save this as a PDF and upload it through the BRD Submission Form, along with your basic details (name, employee PIN, project name). Supporting materials, a wireframe, a sample, or reference links are optional but welcome.
